

Tips In Birdhouse Design

The avid bird watcher will enjoy specific types of exotic birds as much as the normal plethora of birds that come and go in different regions. But giving the birds a solid form of housing can keep a certain type of liked bird in the area longer, and can give bird watchers an up close view of nature.

Birds who like to live in a congregation will not normally take housing in a conventional birdhouse. Instead, they tend to find other housing arrangements that allows them to be with other birds of their species. Birdhouses with multiple compartments and feeders will appeal to these types of birds as a result. The Purple Martin bird is a prime example of such a bird that conforms to this behavior.

The average birdhouse has a rather large hole so that medium and large birds can take residence as well as small birds. But for the swallow, these over sized holes can be dangerous to their health, and they will not commonly take residence in a birdhouse that has an entry point that is larger than an inch and a half in diameter. Therefore, swallows and other birds can only usually be seen when proper hole lengths are created.

The classic birdhouse, which is only one compartment, appeals to birds such as the woodpecker. Such birds are fine with not nesting with other birds of their type, do not usually need a specific hole margin, and will generally live in a wide variety of birdhouses. This means that the average birdhouse obtained or made can appeal to a wide variety of birds- just like the woodpecker. But in the woodpecker's case, they don't add cushion to their nests, so adding a bit of woodchips will help provide safety for eggs.

Other types of birds will need a large space in which to build their own nest in. Just like the woodpecker, the Great Crested Flycatcher will be able to make use of most conventional birdhouses. But this bird will attempt to make its own nest in the birdhouse- meaning it should be slightly larger than the average birdhouse most are accustomed to. It's important to include an easy way of cleaning the birdhouse when making them.

While there have been quite a few different living arrangements discussed, many birds will be perfectly fine with taking up residence in a tree or bush. This means that bird watchers don't have to conform to every whim of a specific bird to try and get them to take residence in a birdhouse- but the extra effort helps.

Closing Comments

Bird watching can be a very enjoyable sport for the elderly, or for anyone with a good appreciation of nature. Whatever the case, putting out the correct birdhouse in order to see a certain type of species of bird will be necessary for bird watchers to get maximum effect from nature. If all else fails, buying a birdhouse from the hardware department of many general stores can make the process much simpler in design and in terms of effort.
