

Are You Concerned About What Your Cat is Eating?

Although commercial cat food companies will use such terms as; super premium, premium, natural and quality, there are no legal or scientific definitions for those terms. When it comes to cat foods, the source of the ingredients (animal or plant) really does matter.

Have you attempted several ways to get your cat to lose weight but none have worked?

Obesity in cats has reach a crisis. This crisis occurred as a result of feeding them too much of the wrong foods. If you take your cat off carbohydrates and feed him/her a meat-based diet, your cat will be healthier and happier. Start your cat on an exercise program like; climbing a tree, fetching a ball or playing with toys. Additionally, your cat will avoid health problems brought on by obesity that can be quite costly.

Do you know what to change your cat's diet too?

We should be reasonable when addressing this situation. Let's consider our domestic cats' origin. The wild cats of Africa is where our domestic cats descended. Thanks to Mother Nature, cats thrive in a desert climate.

There is not much water in a desert. Therefore, cats naturally have a low thirst drive. Additionally, cats are carnivores but not just carnivores but rather obligate carnivores - meaning that they have to eat meat. They derive their needed nutrients from raw meats. Not many plants are indigenous to a desert environment.

A cat's digestive system was designed by Mother Nature to efficiently digest meat, bones and most bacteria. A digestive system is acidic and short and is perfect for digesting a cat's natural diet. Fruits, vegetables and other plant foods are not part of a cat's evolutionary process and should not be fed to them.

It's not uncommon, in the desert, to witness cats enjoying a meal of prey that's been dead for awhile and swarming with parasites

The organ meats, of their prey, provide moisture. Their prey's stomach content, provide seeds, wild grasses, berries and various nuts. Their prey's bones serve as tooth brushes for cats.

A cat's prolong intake of dry food will cause dehydration because the dry food will absorb the cat's moisture from within and that will lead to other problems such as; diabetes, urinary track problems, a weaken immune system and death.

Why would commercial cat food companies produce such non-beneficial cat foods?

PROFITS - grains are cheaper than meats - then they load up the dry foods with harmful preservatives. All of this spells danger for our domestic cats.

The unprovable claims made by the commercial cat food companies that their dry foods are wholesome, nutritious, all natural and well-balanced flies in the face of reason.

What should you feed your cats?

Never ever feed your cat any dry commercial cat food. Dry food is harmful to your cat. It's best to feed your cat a raw meat diet and avoid feeding your cat carbohydrates.

When purchasing food for your cat, always be mindful that cats are not humans. Our dietary requirements are different from humans. Return the love your cat has shown you and your family by feeding him/her food that is beneficial to them and enhance their longevity. By doing that, you will have greatly reduced the chance of your cat dying a premature death.
