

## How to Select the Right Aquarium for Your Fish

A fish tank is a replacement of the natural habitat of fish so that they are displayed in a home or any other place for aesthetic purposes. There are several factors that must be put into consideration when purchasing a fish tank.

One of the factors is considering the type of fish, which will be placed inside the tank. There are other fish that do well in relatively small tanks while others enjoy being in a large space provided by a large aquarium. Ensure that the fish tanks bought are able to handle adequate number of fish.

The other factor to be considered is the space available either at home or at the office. An individual just starting out to keep fish should select fairly small fish tanks such as the 5 gallon tank. Persons who have small space should consider keeping a small number of fish.

Since maintaining fish bowls is restrictive, they should not be used. Furthermore, the aquarium's shape is also important and must be considered when deciding the right tank to purchase. Hexagonal and rectangular are the two most popular fish tanks. Other available tanks include coffee tables aquariums, slender fish tanks as well as bubble aquariums. Slender tanks are ideal to be fitted on walls.

It is important to keep in mind the location where the tank will be placed when considering which shape of tank to buy. The location chosen should be ideal. Rectangular shaped fish tanks are ideal for ensuring the fish live in a healthy environment and the water stays fresh. This is because the surface area in these tanks is wide and this allows for proper circulation of air inside the aquarium.

The tank allows for free exchange of gases within the tank thereby making the aquarium very healthy. A hexagonal tank on the other hand does not allow for good aeration and will require high level maintenance. In addition, the number of fish that can be hosted within this tank is limited.

Finally, the tank's location is also important in regard to the weight of the aquarium to be purchased. The tank's weight tends to determine where the tank will be located. The location where the tank is placed should be able to offer sufficient support for the tank and enable it to retain stability.
